             high altitude pulmonary edema (HAPE). The method comprises amplifying intron 7 of the human inducible nitric oxide synthase (INOS) gene (ADZ7574) by designing and synthesizing forward and reverse oligonucleotide primers (ADZ75765+ADZ75766), and predicting and statistically analyzing differences in the distribution of the allelic variants in the populations, where GG genotype at 19480 position are at low risk of HAPE, and AA genotype at 19480 position are at HAPE. The present sequence represents exon 7 of the human iNOS gene.
  invention relates to a novel method for detecting predisposition to

         inhibit in vitro inducible nitrogen oxide synthase (iNOS) activity. The method comprises contacting the iNOS monomer with a candidate compound, and selecting those compounds that bind to it. As dimerisation of INOS is the final step of the acquisition of the iNOS enzymatic activity, iNOS inhibitor compounds can can be quickly and efficiently screened. The inhibitors are useful for treatment and prevention of organ rejection, cerebral infarction and vascular ischemia. The present sequence encodes a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The specification describes a method of screening for compounds that inhibit in vitro inducible nitrogen oxide synthase (INOS) activity. The method comprises contacting the INOS monomer with a candidate compound, and selecting those compounds that bind to it. As dimerisation of INOS is

The microarray is useful in disgnosing a condition associated with PNI activity, such as CFS, type-2 diabetes, allergic condition, inflammation, cancer and infection. The present sequence represents a psychoneuroendocrinimmune gene expressed sequence tag. Note the specificatio mentions SEQ ID NO of up to 31314 but only sequences up to

The invention relates to a method for detecting a lung cancer-associated transcript in a cell from a patient, comprising contacting a biological sample from the patient with a polyuncleotide that selectively hybridises to a sequence that is at least 80 % identical to a gene that exhibits increased or decreased expression in lung cancer samples, Lung cancer-associated polymeted polypeptides are used for identifying a compound that modulates a lung cancer-associated polypeptide, for inhibiting proliferation of a lung cancer-associated cell to treat lung cancer in a patient and for treating a mammal having lung cancer by administering a modulatory compound identified. The methods are useful for treating lung cancer, such as small cell lung cancer, non-small cell

lung cancer or other benign or precancerous lesions, e.g. atelectasis, emphysema, bronchitis, chronic obstructive pulmonary disease, fibrosis, hypersensitivity pneumonitis, interstitial pulmonary fibrosis, asthma and bronchiectasis. The genes, polymucleotides and polypeptides are useful for diagnostic purposes and as targets for screening for therapeutic compounds that modulate lung cancer, such as antibodies. Sequences ABX76124-ABX76474 represent lung cancer-associated polymucleotides of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              120
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The present invention relates to screening assays for testing nutraceuticals. The invention provides methods for detecting RNA in cells exposed to various types, concentrations, and combinations of nutraceuticals using the INVADER detection assay. The INVADER detection assay detects and quantifies test gene mRNA. The INVADER assay detection reagents comprise a probe and an INVADER oligonucleotide. The invention provides a high throughput, sensitive, quantitative, and cost-effective method of testing nutraceuticals. The present sequence represents human nitric oxide synthase 2A (NOS2A) mRNA.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Testing nutraceutical by providing cells, nutraceutical, and INVADER assay detection reagents, exposing cells to nutraceutical, lysing cells; and contacting cell lysate with INVADER assay detection reagents.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              GGCTACCAGATGCCAGATGGCAGCATCAGAGGGGACCCTGCCAACGTGGAATTCACTCAG

The invention relates to a novel method for in vitro detection of systemic inflammatory response syndrome (SIRS). The method comprises detecting abnormal expression of disease-related genes, or their associated peptides. The method of the invention demonstrates antibacterial, immunosuppressive and antiinflammatory applications and may be used for early differential disaposis, monitoring progression, assessing risk, assessing the likely response to treatment and for post mortem disaposis of systemic inflammatory response syndrome, sepsis and sepsis like conditions. The recombinant or synthetic acid sequences of the invention, or derived proteins or peptides, may be useful as calibrants in assays for the specified diseases, for evaluating activity or toxicity in screening for active agents and/or for preparation of agents for treatment or prevention of the specified diseases. The current sequence is that of a human SIRS/sepsis disapostic marker DNA fragment of the invention. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published

used to diagnose a particular condition, disease or disorder associated with human molecules, e.g. cell proliferative disorder, autoimmune/inflammatory disorder, developmental disorder, endocrine disorder, neurological disorders, gastrointestinal disorders, or infections caused by virus, bacteria, fungi or parasite. The dithp molecules may also be used in genetic mapping, in identifying individuals from minute biological samples, in detecting single nucleotide polymorphisms, as molecular weight markers, and for somatic or germline gene therapy. The present sequence data for this patent is not represented the invention. Note: The sequence data for this patent is not represented in the printed specification, but was obtained in electronic format

The invention relates to a combination which, comprises a number of polynucleotide probes comprising a sequence selected from one of the 1490 sequences mentioned in the specification. The combination is useful as an array element in a microarray for monitoring the expression of a number of target polynucleotides. The microarray is particularly useful in the diagnosis and treatment of cancer and immunopathology and neuropathology. The microarray is useful in diagnostics and treatment regimens, drug discovery and development, toxicological and carcinogenicity studies, forensics and pharmacogenomics. The microarray is also useful for
                                                                                                                                                                                                                                                                                                                                                                             850 CAGCGGAGTGATGGCAAGCACGACTTCCGGGTGTGAAATGCTCAGCTCATCCGCTATGCT 909
antioxidising agent. The methods can be used for protecting cells against immunotoxicity mediated by, e. g. 1L-1 beta, 1L-1 alpha, gamma IFN, TNF alpha, TNF beta, 1L-8, 1L-7, 1L-9, 1L-14, 1L-17, granulocyte-macrophage colony stimulating factor or monocyte chemoattractant protein-1. The methods can be used for the treatment of e.g. insulin-dependent diabetes mellitus (IDDM), NIDDM, obesity, wasting syndromes, short stature, osteoporosis, inflammatory diseases, autoimmune

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Inhibition of cytokine mediated immunotoxicity of cells can be achieved by blocking free radical production or the accumulation of free radicals in that cell. Treatment of insulin dependent diabetes mellitus (IDDM) can be achieved by by blocking nitric oxide (NO) production in a pancreatic beta cell and by providing a composition comprising an agent that reduces levels of fatty acids in the cells and protects beta-cells of the subject against lipid-mediated cell death. Cells can also be protected against nitric oxide mediated cytotoxicity by introducing into the cell an

monitoring progression of diseases and for developing sophisticated profiles for the effects of currently available therapeutic drugs. The combination is also useful for purifying a subpopulation of mRNAs, cDNAs and genomic fragments and in research and diagnostic applications. The array can detect changes in expression in a large number of genes coding for different signaling pathway populations which can be used to diagnose various diseases including cancer e.g. adenocarcinoma and leukaemia, immunopathies e.g. AlDS and asthma, neuropathies e.g. Alzheimer's disease and Parkinson's disease. The present sequence represents a polynucleotide probe of the invention. Note: The sequence data for this patent did not form part of the printed specification but was obtained in electronic format directly from USPTO at
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Human; probe; ss; receptor-like polypeptide; transducing polypeptide; effector-like polypeptide; cancer; immunopathology; neuropathology; drug development; toxicology; carcinogenicity; signalling pathway polypeptide; adrenal gland; bladder; bone; bone marrow; brain; breast; cervix; tumour; immunopathology; diabetes; pancreatitis; osteoporosis; ulcerative colitis; neuropathology; dementia; amnesia; epilepsy; Alzheimer's disease; depression.

Claim 6; SEQ ID NO 1478; 73pp; English

```
The invention relates to a composition of polynucleotide probes comprising first polynucleotide probes comprising at least a portion of a gene encoding a receptor-like polypeptide, second polynucleotide probes comprising at least a portion of a gene encoding a transducing comprising at least a portion of a gene encoding a refector-like polypeptide. The probes of the composition are useful as array elements in a microarray for monitoring the expression of target polynucleotides. The microarray for monitoring the expression of target polynucleotides. The microarray is useful in the diagnosis and treatment of cancer, an immunopathology or a composition are associated for monitoring the progression of diseases to micropathology. It can also be used for drug discovery and development, consuropathology. It can also be used for monitoring the progression of diseases that may be associated with the altered expression of signalling pathway polypeptides. The composition can also be used to purify a subpopulation of minkas, cDNMs, or genomic fragments in a sample. The expression profile communopathology, e.g. AIDS, diabetes, pancreatitis, osteoporosis or ulcarative colities, or a neuropathology, e.g. dementia, amnesia, culcarative colities, or a neuropathology, e.g. dementia, amnesia, content of the progression. This sequence represents a human polynucleotide probe of the invention. Note: The sequence data for chis patent did not form part of the printed specification but was
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    909
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               120

The present invention describes a method of testing for bronchial asthma or chronic obstructive pulmonary disease. The method comprises determining the expression level of a marker gene in a biological sample from a subject, comparing the expression level determined with the expression level of the marker gene in a biological sample from a healthy comparing the expression level of the marker gene in a biological sample from a healthy constructive pulmonary disease. The marker gene comprises: (a) a group of genes (51) whose expression levels increase when respiratory epithelial colls are stimulated with interleukin-13. Also described: (l) a group of genes (52) whose expression levels decrease when respiratory epithelial colls are stimulated with interleukin-13. Also described: (l) a reagent (l) for testing for bronchial asthma or chronic obstructive pulmonary disease; (2) a kit for soreening for andidate compound for a therapeutic agent to treat bronchial asthma or chronic obstructive pulmonary disease; (3) an inducer that induces bronchial asthma in a mouse; (5) a constructive pulmonary disease; (4) an inducer that induces bronchial asthma or chronic obstructive pulmonary disease; (c) asthma or chronic obstructive pulmonary disease, comprising the compound, a marker gene or an antisense nucleic acid corresponding to a portion of the marker gene or an antisense nucleic acid corresponding to a portion of the marker gene or an antisense nucleic acid corresponding to a portion of the marker gene a ribozyme, a polynucleotide that suppresses the expression of the gene through an RNAi effect or an antibady recognising a probe has been immobilised to assay a marker gene. (1) has respiratory content encoded by a marker gene; and (7) a DNA chip for testing for corresponding to a portion of bronchial asthma or chronic obstructive pulmonary disease. The present is useful for testing for or screening to a procession of the seventing to a procession of the sequence is used in the exemplification of the present invence is use

The present invention describes a method of testing for bronchial asthma or chronic obstructive pulmonary disease. The method comprises or chronic obstructive pulmonary disease. The method comprises cor chronic obstructive pulmonary disease. The marker gene in a biological sample from a subject, comparing the expression level of the marker gene in a biological sample from a healthy comparing the expression levels from a biological sample from a healthy compared to the marker gene in a biological sample from a healthy compared to the marker gene comprises: (a) a group of genes (S1) whose expression levels increase when respiratory epithelial colls are stimulated with interleukin-13. Or (b) a group of genes (S2) whose expression levels decrease when respiratory epithelial cells are stimulated with interleukin-13. Also described: (1) a reagent (1) for certing for bronchial asthma or chronic obstructive pulmonary disease; (2) a kit for screening for a candidate compound for a therapeutic agent to trreat bronchial asthma or chronic obstructive pulmonary disease; (5) a manimal model for bronchial asthma or chronic obstructive pulmonary disease; (5) a conting an animal model for bronchial asthma or chronic obstructive pulmonary disease, compound, a marker gene or an antisense nucleic acid corresponding to a portion of the marker gene or an antisense nucleic acid corresponding to a portion of expression of the gene through an RNAi effect or an antibod by a marker gene; and (1) a DNA chip for testing for expression of the gene through an RNAi effect or an antibod or a chronic obstructive pulmonary disease, on which a proche in encoded by a marker gene; and (1) a DNA chip for testing for a protein encoded by a marker gene; and (1) a DNA chip for testing for a protein encoded by a marker gene; and (1) a DNA chip for testing for a protein encoded by a marker gene; and (1) a DNA chip for testing for a protein encoded by a marker gene; and (1) a DNA chip for testing for a protein encoded by a marker gene; and (1) a DNA chip 
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   and antiasthmatic activities, and can be used in gene therapy. The method is useful for testing for or screening for a therapeutic agent for bronchial asthma or chronic obstructive pulmonary disease. The present sequence is used in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        850 cascosadrearescanscaceartreesstreasarescarecterarestrates 909
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         910 GGCTACCAGATGCCAGATGGCAGCATCAGAGGGGACCCTGCCAACGTGGAATTCACTCAG 969

This cDNA sequence includes a coding region for human penis inducible nitric oxide synthetase (HPiNOS) (see AAW36113). It was isolated by reverse transcription of mRNA from human penile smooth muscle cells with iNOS antisense primers, combined with PCR amplification of the resulting cDNA fragments. The invention is directed to a method of treating crectile dysfunction in a patient by providing an agent capable of treating erectile dysfunction, and introducing an effective amount of the agent into the penile tissue of the patient. Preferably, the agent induces cavernosal smooth muscle relaxation, and/or produces an increase in the level of NOS in tissue. Preferably, the NOS is iNOS, and the agent is introduced into the corpora cavernosa of the penis. The agent is introduced into the corpora cavernosa of the penis. The agent is preferably an NOS inducer, an NOS protein such as HPINOS, a cDNA encoding an NOS such as HPINOS, or cDNA-transformed penile cells, especially corpora
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ö

The invention relates to a novel method for identifying an individual who has an altered risk for developing myocardial infarction. The method comprises detecting a single nucleotide polymorphism (SNP) in any one of the nucleotide sequences given in the specification in the individual's nucleic acids, where the presence of the SNP is correlated with an altered risk for myocardial infarction in the individual. The invention altered risk for myocardial infarction in the individual. The invention correlated represence of the SNP is correlated with an altered risk for myocardial infarction in the individual. The invention of the specification or its comprising an uncleotides where one of the nucleotides is an SNP given in the specification and in the specification, an isolated polypeptide or comprising an amino acid sequence given in the specification, an antibody that specification and which is between about 16 and 1000 nucleotides in the copyuncleotide, a buffer and an enzyme; a method of detecting an SNP in a nucleic acid molecule, a method of detecting an variant polypeptide; and comprising the copyuncleotide, and indecided and an enzyme; a method of detecting an SNP in a nucleic acid molecule; a method of detecting an variant polypeptide; and an enzyme; a method of detecting an SNP in an uncleic acid molecule; a method of detecting an variant polypeptide; and an enzyme; a method of detecting an SNP in an uncleic acid soft the invention may be used in gene therapy. The mycardial infarction. The novel detection method has an increased or method is useful in identifying an individual who has an increased or method is useful in identifying an individual who has an increased or composition for treating or preventing mycardial infarction. This composition for treating or preventing mycardial infarction. This esquence was not shown in the specification. The sequence has come from a electronic sequence listing downloaded from the MIPO website.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Identifying an individual who has an altered risk for developing myocardial infarction by detecting a single nucleotide polymorphism in the individual's nucleic acids.
                                                                                                         Human SNP containing myocardial infarction-associated gene, SEQ ID 621.
                                                                                                                                                     Myocardial infarction; detection; single nucleotide polymorphism; SNP; cardiant; gene therapy; human; gene; ds.

It was obtd. by isolating mRNA from hepatocytes induced in vitro for INOS biosynthesis, preparing a cDNA library in a phage lambda Zap II vector, and screening with a cross-species iNOS probe. The cDNA can be used to prepare iNOS for therappeutic use. Alternatively, it is used in gene therapy strategies for treatment of vascular occlusive disease associate with atherosclerosis, vascular bypass and diabetes mellitus, tumor cell growth, and microbial infections
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Inducible nitric oxide synthase gene - useful in gene therapy to treat, e.g. vascular occlusive disease and cancer.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        AAQ66914 is from human hepatocyte inducible nitric oxide synthase cDNA clone pHINOS from lambda Zap II CDNA library. The original source was induced human hepatocyte RNA. HINOS cDNA plasmid is pref. transformed in E. coli SOLN (APTC 69126). The inventors claim a clone with the cDNA sequence in AAQ66914 and a cDNA clone which encodes AAR55764. The cloning and expression of a human tissue nitric oxide synthase cDNA provides a source of the enzyme for therapeutic purposes, for example to prevent the hypotensive shock seen with sepsis. The present invention describes a new composition comprising an antisense oligonucleotide (DN) with low adenosine (up to 15%), which targets and/or nucleic acids involved in bronchoconstriction, allergies, and/or inflammation. The ON can have antiinflammatory, antiallergic, and/or antiasthmatic, cytostatic and analgesic activities. The compositions are useful for the treatment of diseases associated with inflammation, cantiasthmatic, cytostatic allergies associated with inflammation, constituted airway, including lung disease and diseases whose secondary effects afflict the lungs of a subject. They can be used for treating c.g. ischaemic conditions, pulmonary vasoconstriction, allergies, asthma, impeded respiration, respiratory distress syndrome, pain, cystic fibrosis, pulmonary hypertension, emphysema, chronic obstructive cylmonary disease (COPD), and cancers such as leukaemias, lymphomas, carcinomas, and cancers which may metastasise to the lungs, including CC breast and prostate cancer. The reduction of the adenosine content of the CONS reduces side effects. The A-containing ONS break down with the conceptore side effects. The A-containing ONS break down with the conclosusing which correspond to SEQ ID NO:1 to 2815, and then the last 185 conclosusly mamed sequences listing from the previously mamed sequences. SEQ ID NO:1 to 1880 (AAA3532 or AAA3392) are specifically claimed ONS from the previously mamed sequences. SEQ ID NO:1 to 1880 (AAA3232) concert of the match content in the interest invention do not match iterior which their corresponding SEQ ID NO: sequences given in the sequence jiering the present invention of the match content of the present invention of the present invention of the present invention of the present interest sequences given in the disclosure of the present invention of the present invention of the present invention of the present interest sequences given in the disclosure of the presen

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The present invention describes low adenosine (A) content antisense oligonucleotides and compositions (I) comprising them. In the antisense oligonucleotides the A is replaced by a 'Universal' or alternative base.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              (I) can have respiratory, bronchodilator, antiinflammatory, analgesic, immunosuppressive, antiasthmatic, hypotensive and cytostatic activities. The antisense oligomicleotides and (I) can be used to down-regulate the expression and or activity of text polypeptides associated with lung/respiratory disorders and malignancies, such as stimulating and activating peptide factors and transmitters, transcription factors,

chemokines, endogenously produced specific and non-specific enzymes, binding proteins, adhesion molecules and their receptors, cytokine and chemokine receptors, adenosine receptors, binding proteins, adenosine receptors, central nervous system (CNS) and peripheral nervous and non-nervous system receptors, CNS and peripheral nervous and non-nervous system peptide transmitters, defensine, growth factors, vascoative peptides and receptors, binding proteins and malignancy associated proteins. The antisense oligonucleotides may be used in this way to treat disorders including respiratory obstruction (especially pulmonary obstruction surfactant hypoproduction) and/or lung inflammation, allergy(ies) and/or condition selected from pulmonary vasocoated with a disease or condition selected from pulmonary vasocoatriction, inflammation, allergies, asthma, impeded respiration, respiratory distress syndrome (RDS), pain, cystic fibrosis (CP), allergic rhinitis (AR), pulmonary hypertension, emphysema, chronic obstructive pulmonary disease (CPPD),

                                                                                                                                                                                                       The invention relates to antisense compounds, especially oligonuclectides, which are targeted to a nucleic acid encoding inducible nitric oxide synthase and which specifically hybridise to and modulate expression of inducible nitric oxide synthase. The antisense compounds have immunomodulator, antidiabetic, cardiovascular, cardiant, neuroprotective, disorder and vasotropic activity. The antisense oligonuclectides are useful for inhibiting the expression of inducible nitric oxide synthase in cells or tissues. In particular, the antisense oligonucleotides are useful for inhibiting diseases or disorders associated with inducible nitric oxide synthase, e.g. diabetes, immunological disorder, cardiovascular disorder, neurological disorder, cardiovascular disorder, neurological disorder or laborate of mouseful for research and diagnostics. The present sequence is that of mouse inducible nitric oxide synthase (Genbank accession number M92649)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ö
                                                                      New antisense oligonucleotides for modulating the expression of inducible nitric oxide synthase in cells or tissues, particularly useful for treating e.g. immunological, cardiovascular or neurological disorders, or

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           1010
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The invention relates to antisense compounds, especially oligonucleotides, which are targeted to a nucleic acid encoding inducible entric oxide synthase and which specifically hybridise to and modulate expression of inducible nitric oxide synthase. The antieense compounds have immunomodulator, antidiabetic, cardiovascular, cardiant, neuroprotective, disorder and vasotropic activity. The antisense oligonucleotides are useful for inhibiting the expression of inducible nitric oxide synthase in cells or tissues. In particular, the antisense oligonucleotides are useful for treating diseases or disorders associated with inducible nitric oxide synthase, e.g. diabetes, immunological disorder, cardiovascular disorder, neurological disorder or ischaemia/reperfusion injury. The antisense oligonucleotides are also

The invention relates to a novel pharmaceutical composition, which has a first active agent comprising an oligonucleotide antisense to the initiation codon, coding region, 5' or 3' end genomic flanking regions, 5' and 3' intron-exon junctions, or regions within 2-10 nucleotides of junctions of genes encoding a polypeptide associated with lung and/or nasal airway dysfunction and a second active agent comprising an antiliflammatory steroid and ubiquinone. A composition of the invention has antilinflammatory and ubiquinone. A composition may have a immunosuppressive, and cytostatic activity. The composition may have a cuse in antisense gene therapy. The composition is useful for treating or preventing a respiratory, lung or malignant disease or condition, also for enhancing the prophylactic or therapeutic respiratory effect of an antilifammatory steroid in a subject. for reducing levels of adenosine receptor, producing bronchodilation, increasing levels of adenosine receptor, producing bronchodilation, increasing levels of upiquinone or lung surfactant in a subject's tissue, or treating bronchoonstriction. In a subject of the pronchodilation, increasing levels of adenosine lung inflammation, lung allergies, or a respiratory disease or condition. Note: The sequence data for this patent is not represented in the printed specification, but was obtained in electronic format directly from WIPO
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   1010
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          61 GGCTACCAGATGCCAGATGGCAGCATCAGAGGGGACCCTGCCAACGTGGAATTCACTCAG 120

This invention describes a novel composition (a) a first active agent, comprising oligonucleotides, effective for alleviating comprising oligonucleotides, effective for alleviating bronchoconstruction, respiratory tract inflammation, allergies and reducing adenosine sensitivity, levels of adenosine (A) receptors, surfactant depletion or hyposecretion, when administered to a mammal. The oligonucleotides are derived from a gene encoding or regulating expression of a target polypeptide associated with lung airway or lung airwaton or cancer and can be anti-sense to the corresponding mRNA. The invention also describes a kit, that comprises: (a) a delivery device, in separate containers, (b) the oligonucleotides, (c) instructions for adding a carrier and for use of the kit. The composition of the invention has antiallergic, antiinflammatory, antiachmatic, analgesic, hypotensive, immunosuppressive and cytostatic activity, is a beta-adrenergic agonist. The composition is useful for preventing or treating a respiratory, lung or malignant disease. The administered composition comprises oligo and is administered to reduce the production or availability, or to increase the degradation of the target mRNA or to reduce the amount of target polypeptide present in the lungs. The pulmonary obstruction, and/or bronchoconstriction and/or lung inflammation, allergies and/or surfactant hypoproduction are associated with a disease or condition such as pulmonary vascconstriction, confirming and as pulmonary vascconstriction, confirming and administration, pulmonary incections, bronchitis or cancer. The reduced adenosine content of the anti-sense oligos corresponding to thymidines present in the target RNA serves to prevent the breakdown of the oligonucleotides into products that free adenosine into the system e.g., lung, brain, heart, kidney, ecc, tissue environment and thereby, to prevent any unwanted effects due to it
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                1011 GGCTACCAGATGCCAGATGGCAGCATCAGAGGGGACCCTGCCAACGTGGAATTCACTCAG 1070

```
nitric-oxide-synthase. cDNA was generated and used to construct a library in lambda ZAPII. This was screened with a 650 bp fragment of mouse inducible NO-synthase cDNA to identify the full-length clone pBSHSINOS. The insert was transferred to pSVL to give a vector capable of expressing NO-synthase in CHO cells under control of a hererologous constitutive promoter. (Updated on 25-MAR-2003 to correct PN field.)

The invention relates to a composition comprising a plurality of CDNAs for detecting the altered expression of genes in an immunological invention also relates to a method of diagnosing or monitoring the treatment of an immunopathological condition in a sample, contacting the treatment of an immunopathological condition in a sample, contacting the treatment of an immunopathological conditions to form one or more hybridisation complexes, detecting the nucleic conditions to form one or more hybridisation complexes and comparing the levels of the detected in a non-diseased sample, where an altered level of the detected hybridisation complexes correlates with the presence of an immunopathological condition. Also disclosed are an expression profile comprising a microarray and a plurality of detectable complexes and the comprision of target polymucleotides. The microarray for monitoring are useful as hybridisable array elements in a microarray for monitoring the diagnosis of an immunopathology, such as Crohn's disease, asthma, culerative colitis, hypereosinophila, irritable bowel syndrome, culerative colitis, hypereosinophila, irritable bowel syndrome, carcinogenicity studies, forensics or pharmacogenomics. The microarray may also be used in drug discovery and development, toxicological and carcinogenicity studies, forensics or pharmacogenomics. The composition may also be used in purification of a subpopulation of a fundation. Mote: The sequence cata for this patent did not form part of the printed specification but was obtained in electronic format directly the printed parent of the printed format directly
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    A composition comprising a plurality of cDNAs, useful for detecting altered expression of genes in an immunological response or for diagnosing and treating an immunopathology, e.g. Crohn's disease, asthma or osteoarthritis.

The polynucleotides are useful in research and diagnostic applications particularly in cancer and atherosclerosis, bronchitis, ulcerative colitis, diabetes, anaemia, asthma, atherosclerosis, bronchitis, ulcerative colitis, diabetes, multiple sclerosis, osteoporosis, pancreatitis, infections and arthritis. The present sequence represents a human lymph node cDNA used to detect blood cell and immunological response gene expression. Note: The present sequence does not appear in the printed specification but was obtained in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 New compositions having a number of first, second and third polynucleotide probes, useful in research and diagnostic applications in cancer and immunological conditions e.g. AIDS, diabetes, osteoporosis and

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The invention relates to a novel method for identifying an individual who has an altered risk for developing myocardial infarction. The method comprises detecting a single nucleotide polymorphism (SNP) in any one of the nucleotide sequences given in the specification in the individual's nucleic acids, where the presence of the SNP is correlated with an altered risk for myocardial infarction in the individual the invention caltered risk for myocardial infarction in the individual. The invention caltered risk for myocardial infarction in the individual. The invention caltered risk for myocardial infarction in the individual. The invention caltered risk for myocardial infarction in the individual. The invention caltered risk in the specification or its complement and encoding any one of the amino the specification or its complement and encoding any one of the amino calt sequences given in the specification; an antibody that specification and which is between about 16 and 1000 nucleotides in length, a kit for detecting an SNP in a nucleic acid molecule, a method of detecting an SNP in a nucleic acid molecule, a method of detecting an variant polypeptide; and molecule, a method of detecting an variant polypeptide; and method for identifying an agent useful in treating or preventing myocardial infarction. The novel detection may be used in gene therapy. The method is useful in identifying an individual who has an increased or

decreased risk for developing myocardial infarction and for preparing a composition for treating or preventing myocardial infarction. This polynucleotide sequence represents a human myocardial infarction associated gene containing one or more SNP's of the invention. Note: This sequence was not shown in the specification. The sequence has come from an electronic sequence listing downloaded from the WIPO website.
                                                                                                                                                                                                                                                                                                                                                                                    ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             120

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The invention relates to a method of identifying a candidate insulin growth factor receptor (IGFR) pathway modulating agent comprising screening for agents that modulate the activity of a modifier of IGFR (MIGFR). The method comprises providing an assay system comprising an MIGFR polypeptide or polymucleotide, contacting the assay system with a test agent under conditions where, but for the presence of the test
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               modulating agents useful for diagnosing or treating, for e.g. cancer, comprises screening for agents that modulate the activity of a modifier

agent, the system provides a reference activity and detecting a test agent-biased activity of the assay system, where a difference between the test agent-biased activity and the reference activity identifies the test agent as a candidate IGFR pathway modulating agent. The invention also relates to methods for modulating an IGFR pathway of a cell or in a mammallain cell and a method for diagnosing a disease in a patient. The methods are useful for diagnosing or treating cancer or for identifying modulators of an IGFR pathway, which may be utilized as therapeutic targets for disorders associated with defective IGFR function, such as polynucleotide of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            GGCTACCAGATGCCAGATGGCAGCATCAGAGGGGACCCTGCCAACGTGGAATTCACTCAG 120

The invention relates to novel diagnostic and therapeutic polynucleotides selected from one of the 2722 sequences defined in the specification. A polynucleotide of the invention may have a use in gene therappy. The human clasmostic and therapeutic polynucleotides (dithp) or polyneptides may be used to diagnose a particular condition, disease or disorder associated with human molecules, e.g. cell proliferative disorders, autoimmune/inflammatory disorder, questioning disorder, disorder, neurological disorders, gastrointestinal disorders, or infections caused by virus, bacteria, fungi or parasite. The dithp molecules may also be used in genetic mapping, in identifying individuals from minute biological samples, in detecting single nucleotide polymorphisms, as molecular weight markers, and for sommatic or germline gene therapy. The present sequence represents a dithp polynucleotide of the invention. Note: The sequence data for this patent is not represented in the printed specification, but was obtained in electronic format
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             1407

The invention relates to novel diagnostic and therapeutic polynucleotides selected from one of the 2722 sequences defined in the specification. A perform one of the 2722 sequences defined in the specification. A proposed of the invention may have a use in gene therappy. The human diagnostic and therapeutic polynucleotides (dithp) or polypeptides may be used to diagnose a particular condition, disease or disorder associated with human molecules, e.g. cell proliferative disorders, endocrine disorder, neurological disorders, gastrointestinal disorders, or infections caused by virus, bacteria, fungi or parasite. The dithp molecules may also be used in genetic mapping in identifying individuals from minute biological samples, in detecting single nucleotide polymorphisms, as molecular weight markers, and for somatic or germline polymorphisms, as molecular weight markers, a dithp polynucleotide of the invention. Note: The sequence represents a dithp polynucleotide of the invention. Note: The sequence data for this patent is not represented in the printed specification, but was obtained in electronic format
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           1348 CAGCGGGAGTGATGGCAAGCACGACTTCCGGGTGTGGAATGCTCAGCTCATCCGCTATGCT 1407

The present invention describes low adenosine (A) content antisense oligonucleotides and compositions (I) comprising them. In the antisense coligonucleotides the A is replaced by a 'Universal' or alternative base. (C) ilgonucleotides the A is replaced by a 'Universal' or alternative base. (I) can have respiratory, bronchodilator, antinflammatory, analgesic. (I) can have respiratory bronchodilator, antinflammatory, analgesic. (C) immunosuppressive, antiasthmatic, hypotensive and cytostatic activities. (C) the antisense oligonucleotides and (I) can be used to down-regulate the expression and or activity of target polypeptides associated with conting peptide factors and malignancies, such as stimulating and contingual proteins and transmitters, transcription factors, contral communoglobulins and antibodies, antibody receptors, cytokines and chemokine, endogenously produced specific and non-specific enzymes, contral chemokine receptors, adenosine receptors, bradykinin receptors, contral corvous system (CNS) and peripheral nervous and non-nervous system corresponders, CNS and peripheral nervous and non-nervous system creeptors, binding proteins and malignancy associated proteins. The receptors, binding proteins and malignancy associated proteins. The creeptors, binding proteins and malignancy associated proteins. The antisense oligonucleotides may be used in this way to treat disorders including respiratory obstruction (especially pulmonary obstruction and/or bronchoconstriction) and/or lung inflammation, allergy(ies) and/or condition and from malignancy associated with a disease or condition and from malignancy associated with a disease or condition and from malignancy associated with a disease or condition and from malignancy and proteins and malignancy associated with a disease or condition which are associated with a disease or condition which are associated minimum and malignanc
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              1011 GGCTACCAGATGCCAGATGGCAGCATCAGAGGGGACCCTGCCAACGTGGAATTCACTCAG 1070
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ö

Pabalan J, Aguilar D;

The invention relates to a novel pharmaceutical composition, which has a first active agent comprising an oligonucleotide antisense to the initiation codon, coding region, 5' or 3' end genome flanking regions, 5' and 3' intron-exon junctions, or regions within 2-10 nucleotides of junctions of genes encoding a polypeptide associated with lung and/or nasal airway dysfunction and a second active agent comprising an antiinflammatory steroid and ubiquinone. A composition of the invention has antiinflammatory, antiallergic, antiasthmatic, hypotensive, immunosuppressive, and cytostatic activity. The composition may have a composition a natisense gene therapy. The composition is useful for treating or preventing a respiratory, lung or malignant disease or condition, also for enhancing the prophylactic or therapeutic respiratory effect of an antiinflammatory steroid in a subject, for reducing or depleting levels of of, or reducing sensitivity to adenosine, reducing levels of adenosine receptor, producing bronchodilation, increasing levels of adenosine creeptor, producing bronchodilation, increasing levels of ubiquinone or lung inflammation, lung allergies, or a respiratory disease or condition, lung allergies, or a respiratory disease or condition. Note: The sequence data for this patent is not represented in the printed process or sequence data for this patent is not represented in the printed process or sequence data for this patent is not represented in the printed process or sequence data for this patent is not respiratory disease.

Claim 15; SEQ ID NO 12386; 763pp; English.

currenting adenosine sensitivity, levels or adenosine (A) or (A) receptors, curfactant depletion or hyposecretion, when administered to a mammal. The oligonucleotides are derived from a gene encoding or regulating conjugonucleotides are derived from a gene encoding or regulating conjugonucleotides are derived from a sense to the corresponding mRNA. The invention also describes a kit, that comprises: (a) a delivery or lung device, in separate containers, (b) the oligonucleotides, (c) containers, (do instructions for adding a carrier and for use of the kit. The composition of the invention has antiallergic, antiinflammatory, antiasthmatic, analgesic, hypotensive, immunosuppressive and cytostatic activity, is a beta-adrenergic agonist. The composition is useful for preventing or treating a respiratory, lung or malignant disease. The administered composition comprises oligo and is administered to reduce the production or availability, or to increase the degradation of the target mRNA or to crackuce the amount of target polypeptide present in the lungs. The pulmonary obstruction, and/or bronchoconstriction and/or lung inflammation, allergies and/or surfactant hypoproduction are associated with, a disease or condition such as pulmonary viseostriction, contained and allergies, asthma, impeded respiration, respiratory contains at him at incompay and a second allergies, asthma, impeded respiration, respiratory contains pain, cystic fibrosis, allergic rhinitis, pulmonary contranspondence ontent of the anti-sense oligos corresponding to the reduced adenosine content of the anti-sense oligos corresponding to thymidines present in the target RNA serves to prevent the breakdown of the oligonucleotides into products that free adenosine into the system receptors, This invention describes a novel composition (a) a first active agent, comprising oligonuclectides, effective for alleviating. bronchoconstriction, respiratory tract inflammation, allergies and reducing adenosine sensitivity, levels of adenosine (A) or (A) receptor

The ON can have antiinflammatory, antiallergic, antiasthmatic, cytostatic and analgesic activities. The compositions are useful for the treatment of diseases associated with inflammation, impaired airways, including lung disease and diseases whose secondary effects affilict the lungs of a subject. They can be used for treating e.g. ischaemic conditions, pulmonary vasoconstriction, allergies, asthma,

Fibrosis, plannary hypertension, emphysems, fironic obstructive pulmonary disease (COPD), and cancers such as leukaemias, lymphomas, carcinomas, and cancers which may metastasise to the lungs, including breast and prostate cancer. The reduction of the adenosine content of the calcuses side effects. The A-containing ONs break down with the release of deoxyadenosine which activates adenosine receptors causing bronchoconstriction and inflammation. AAA3233 to AAA35312 represent invention, which correspond to SEQ ID No:11 to 285, and then the last 185 sequences are also called SEQ ID No:11 to 185, but the sequences differ from the previously named sequences. SEQ ID No:11 to 1860 (AAA3233 to AAA3392) are specifically claimed ONS from the present invention. N.B. Sequences given in the disclosure of the present invention on one match with their corresponding SEQ ID NO: sequences given in the sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  2242 cagcggagrgarggcaagcacacrrccggrgrggaargcrcagcrcarccgcrargcr 2301

The present invention describes low adenosine (A) content antisense oligonucleotides and compositions (I) comprising them. In the antisense coligonucleotides the A is replaced by a 'Universal' or alternative base. (I) can have respiratory, bronchodilator, antiinflammatory, analgesic, immunosuppressive, antiasthmatic, hypotensive and cytostatic activities. The antisense oligonucleotides and (I) can be used to down-regulate the expression and or activity of target polypeptides associated with lung/respiratory disorders and malignancies, such as stimulating and certivating peptide factors and transmitters, cranscription factors, immunoglobulins and antibodies, antibody receptors, cytokines and chemokines, endogenously produced specific and non-specific enzymes, chemokine receptors, adenosine receptors, cytokine and chemokine receptors, adenosine receptors and heir receptors, cransmitters, defensins, growth factors, vasoactive peptides and receptors, binding proteins and malignancy associated proteins. The receptors binding proteins and malignancy associated proteins. The receptors binding proteins and malignancy associated proteins. The antisense oligonucleotides may be used in this way to treat disorders including respiratory obstruction (especially pulmonary obstruction and/or bronchoconstriction) and/or lung inflammation, allergies, asthma, impeded respiratory vasocoactiction, inflammation, allergies, asthma, impeded respiration, respiratory discress syndrome (CRDs) bronch comes in the series of an elected from pulmonary vasocoactiction, inflammation, allergies, antibors.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               2242 chacceadreareceaagcaceacrircceereresaarecricacricarccerricer 2301

The invention relates to a novel pharmaceutical composition, which has a first active agent comprising an oligonucleotide antisense to the initiation codon, coding region, 5' or 3' end genomic flanking regions, 5' and 3' intron-exon junctions, or regions within 2-10 nucleotides of junctions of genes encoding a polypeptide associated with lung and/or nacal airway dysfunction and a second active agent comprising an antiinflammatory steroid and ubiquinone. A composition of the invention to as antiinflammatory, antiallergic, antiasthmatic, hypotensive, immunosuppressive, and cytostatic activity. The composition may have a cuse in antisense gene therapy. The composition may have a composition may naction are preventing a respiratory, lung or mallignant disease or condition, also for enhancing the prophylactic or therapeutic respiratory effect of an antiinflammatory steroid in a subject, for reducing or depleting levels of or entiinflammation, producing bronchodilation, increasing levels of adenosine receptor, producing bronchodilation, increasing levels of adenosine creceptor, producing bronchodilation, increasing levels of ubiquinone or lung inflammation, lung allergies, or a respiratory disease or condition.

Pharmaceutical composition for treating asthma, has antisense obligonuclocide containing less percentage of adenosine, targeted tuncleic acids associated with lung airway or lung dysfunction, and bronchodilating agent.

Claim 15; SEQ ID NO 11893; 763pp; English.

This invention describes a novel composition (a) a first active agent, comprising oligonucleotides, effective for alleviating comprising oligonucleotides, effective for alleviating comprising oligonucleotides, readiction, respiratory tract inflammation, allergies and reducing adenosine sensitivity, levels of adenosine (A) or (A) receptors, surfactant depletion or hyposecretion, when administered to a mammal. The colsonucleotides are derived from a gene encoding or regulating expression of a target polypeptide associated with lung airway or lung expression of a target polypeptide associated with lung airway or lung device, in separate containers, (b) the oligonucleotides, (c) instructions for adding a carrier and for use of the kit. The composition of the invention as antiallergic, antialitammatory, antianthmater, antianthmater, antialitammatory, in an antialitation and cytostatic activity, is a beta-adrenergic agonist. The composition is useful for preventing or treating a respiratory, lung or malignant disease. The administered composition comprises oligo and is administered to reduce the production or availability, or to increase the degradation of the target mana or analogue present in the lungs. The pulmonary obstruction, and/or bronchoconstriction and/or lung inflammation, allergies and/or bronchoconstriction are associated inflammation, allergies asthma, impeded respiration, respiratory distress syndrome, pain, cystic fibrosis, allergic thinitis pulmonary transplantation rejection, pulmonary infections, bronchitis or cancer. The reduced adenosine content of the anti-sense oligos corresponding to the production and active pulmonary infections are the produced and and active pulmonary infections and active pulmonary infections the present in the target RNA serves to prevent the breakdown of the produced active to the produced

Low adenosine (A) content antisense oligonucleotides which do not trigger adenosine receptors during metabolism, useful e.g. for treating cancers and respiratory obstructions

Disclosure; Page 47-55; 1592pp; English.

oligonuclectides and compositions (I) comprising them. In the antisense oligonuclectides the A is replaced by a 'Universal' or alternative base. (I) can have respiratory, bronchodilator, antinfilammatory, analgesic, immunosuppressive, antisthmatic, hypotensive and cytostatic activities. The antisense oligonucleotides and (I) can be used to down-regulate the expression and or activity of target polypeptides associated with lung/respiratory disorders and mallghancies, such as stimulating and activating peptide factors and transmitters, transcription factors, immunoglobulins and antibodies, antibody receptors, cytokines and chemokines, endogenously produced specific and non-specific enzymes, binding proteins, adenosine receptors, cytokine and chemokine receptors, adenosine receptors, bradkinin receptors, central nervous system (CNS) and peripheral nervous and non-nervous system peptide receptors, defensine, growth factors was one peptide creeptors, binding proteins and malignancy associated proteins. The receptors, binding proteins and malignancy associated proteins. The antisense oligonucleotides may be used in this way to treat disorders present invention describes low adenosine (A) content antisense

(EPIG-) EPIGENESIS PHARM INC

WPI; 2003-229219/22.

Pharmaceutical composition for treating ailments associated with impaired respiration, has oligo(s) antisense to specific gene(s) or its corresponding RNAs, and glucocorticoid or non-glucocorticoid steroid or ubiquinone.

SEQ ID NO 12372; 872pp; English. Disclosure; The invention relates to a novel pharmaceutical composition, which has

first active agent comprising an oligonucleotide antisense to the initiation codon, coding region, 5' or 3' end genomic flanking regions, 5' and 3' intron-exon junctions, or regions within 2-10 nucleotides of junctions of genes encoding a polypeptide associated with lung and/or nasal airway dysfunction and a second active agent comprising an entinflammatory steroid and ubiquinone. A composition of the invention has antiinflammatory, antiallergic, antiasthmatic, hypotensive, cimmunosuppressive, and cytostatic activity. The composition may have a cuse in antisense gene therapy. The composition is useful for treating or preventing a respiratory lung or malignant disease or condition, also for enhancing the prophylactic or therapeutic respiratory effect of an antiinflammatory steroid in a subject, for reducing levels of adenosine or receptor, producing bronchodilation, increasing levels of adenosine creceptor, producing bronchodilation, increasing levels of adenosine creceptor, producing bronchodilation, increasing levels of ubiquinone or lung inflammation, lung allergies, or a respiratory disease or condition.
